

In food! Bacteria are used to ferment many kinds of food, including pickled vegetables, cheese, and coffee.

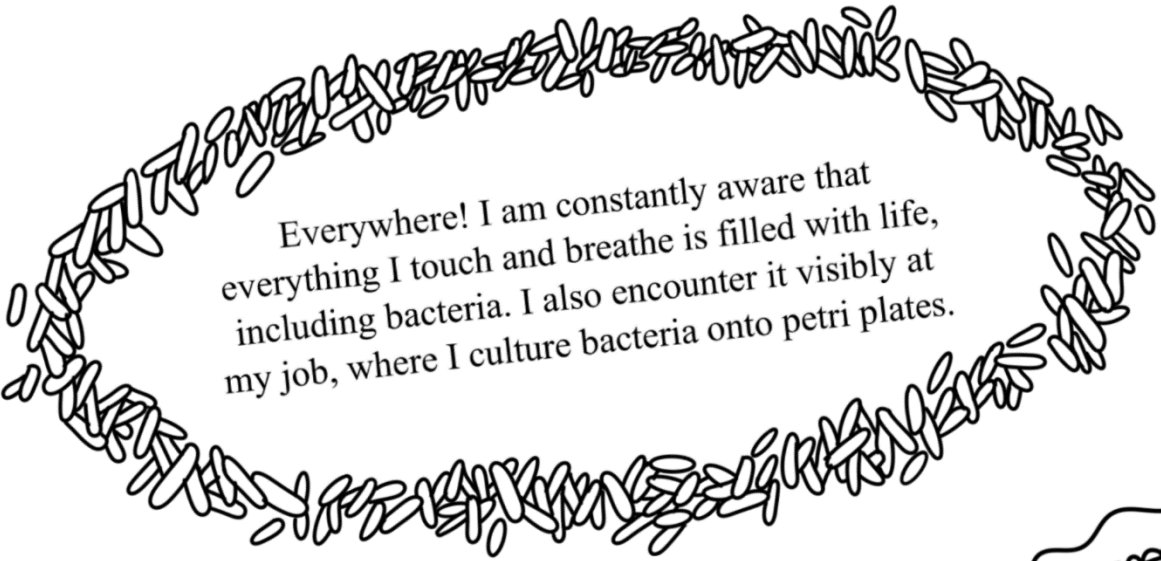

On every surface there is bacteria. I feel like some hot spots are: door handles, toys, and things that are touched all the time.

**WHERE ARE BACTERIA
ENCOUNTERED IN EVERYDAY LIFE?**

What do you think?

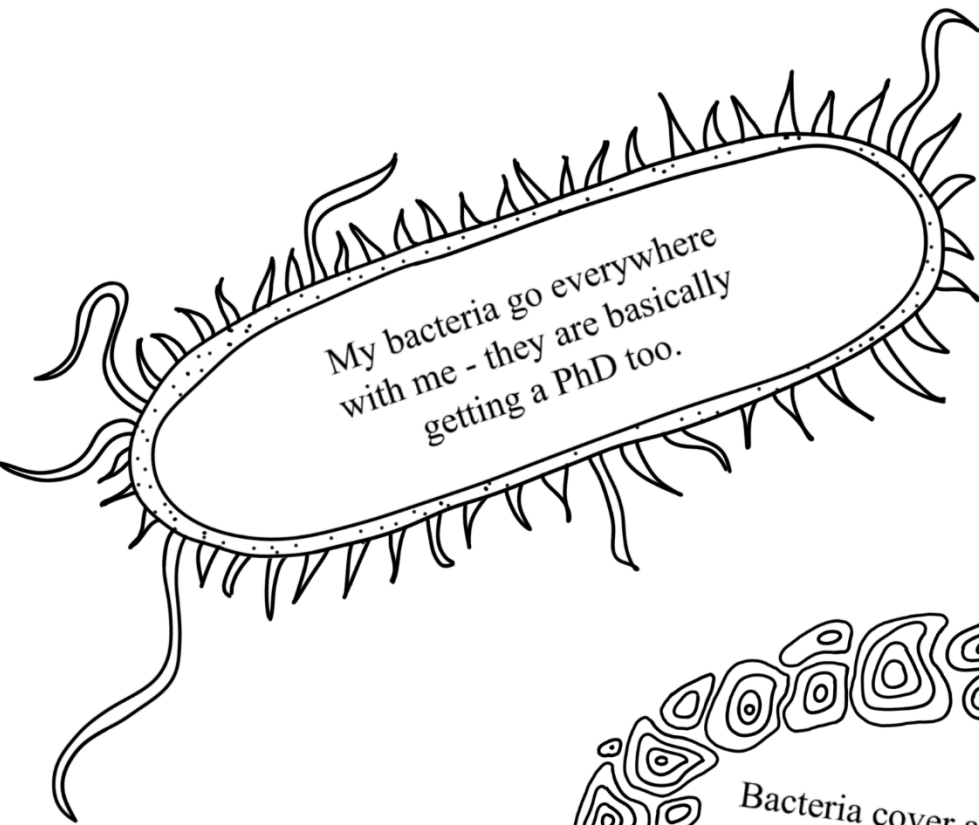

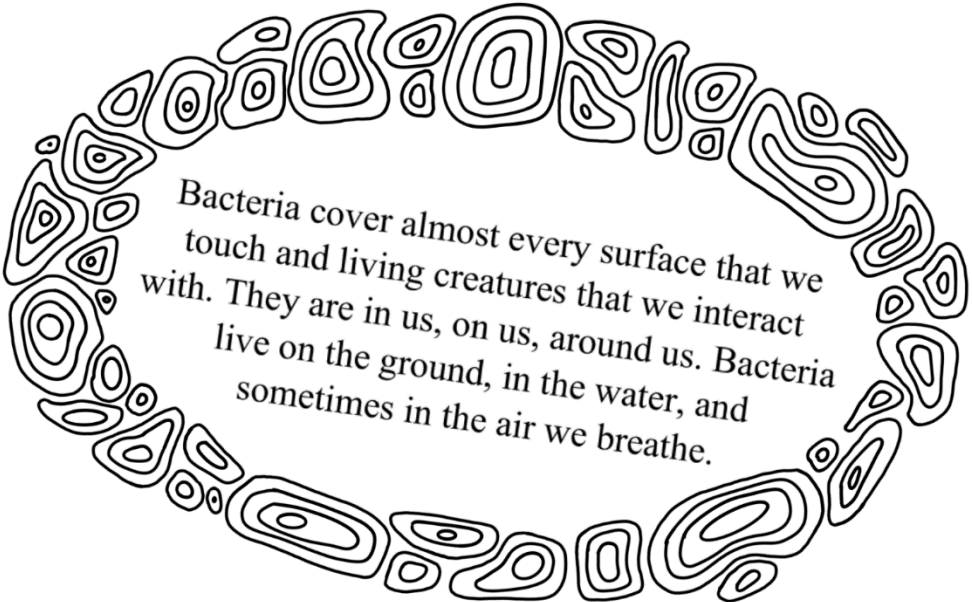

Everywhere! I am constantly aware that everything I touch and breathe is filled with life, including bacteria. I also encounter it visibly at my job, where I culture bacteria onto petri plates.

Everywhere, especially in yucky places.

My bacteria go everywhere with me - they are basically getting a PhD too.

Bacteria cover almost every surface that we touch and living creatures that we interact with. They are in us, on us, around us. Bacteria live on the ground, in the water, and sometimes in the air we breathe.
